(54) Title: PHARMACEUTICAL COMPOSITIONS COMPRISING AMLODIPINE MALEATE

(57) Abstract: An amlodipine maleate pharmaceutical composition is provided with good stability when formulated with a pH within the range of 5.5 to 7, when measured as a 20 wt% aqueous slurry. The stability can also be aided by making the pharmaceutical composition from amlodipine maleate particles having an average particle size of greater than 20 microns, preferably greater than 100 microns.

WO 02/053134 A1

PHARMACEUTICAL COMPOSITIONS COMPRISING AMLODIPINE MALEATE

5

The present invention relates to pharmaceutical compositions comprising amlodipine maleate and to processes for making the same.

Calcium channel blockers are useful in treating a variety of cardiac conditions, primarily angina and hypertension. EP 089 167 and corresponding US 4,572,909
10 disclose a class of substituted dihydropyridine derivatives as being useful calcium channel blockers. These patents identify that one of the most preferred compounds is 2-[(2-aminoethoxy)methyl]-4-(2-chlorophenyl)-3-ethoxycarbonyl-5-methoxycarbonyl-6-methyl-1,4-dihydropyridine. This compound, which is now commonly known as amlodipine, has the following formula:

15

Examples 8, 11, 12, and 22 of EP 089 167 show the synthesis of amlodipine in the maleate salt form. While a variety of acid addition salts are taught to be suitable, the maleate salt is identified as the most preferred acid addition salt.

Subsequently, EP 244 944 and corresponding US 4,879,303 were issued
20 directed to the besylate (or benzene sulfonate) salt of amlodipine. The besylate salt is stated to provide certain advantages over the known salts including good formulating properties. Indeed, amlodipine besylate, and not amlodipine maleate, has been developed into a commercial prescription pharmaceutical by Pfizer and is sold in the U.S. under the trade name NORVASC.

25 A review of the available portions of the NORVASC (amlodipine besylate) New Drug Application (NDA) filed with the U.S. Food & Drug Administration by Pfizer reveals that a switch was made during development from the original amlodipine maleate to the amlodipine besylate. (See "Review of Original NDA" for

NDA# 19-787 of 10.10.1990, obtainable from FDA under Freedom of Information Act). The reasons for the switch were apparently tableting and stability problems. However, the precise stability and tableting problems/issues/causes are not publicly disclosed in the information available from the FDA. Interestingly, clinical studies in the NDA include the use of the maleate salt form and the besylate salt form, the two salt forms being therapeutically equivalent (bioequivalent). However, in these studies amlodipine maleate was always used in a capsule or solution dosage form, not a tablet dosage form.

The present invention relates to the discovery of stable amlodipine maleate pharmaceutical compositions. A first aspect of the invention relates to a pharmaceutical composition comprising an effective amount of amlodipine maleate and at least one pharmaceutically acceptable excipient wherein the composition has a pH within the range of 5.5 - 7.0. The composition is preferably a solid dosage form such as a tablet or capsule. The invention also relates to methods of making such a composition as well as to the use of such compositions in treating or preventing angina or hypertension.

Another aspect of the invention relates to a process which comprises mixing solid particles of amlodipine maleate having an average particle size of at least 20 microns with one or more pharmaceutically acceptable excipients to form a mixture. Preferably the mixture has a pH of from 5.5 to 7.0. The mixture can be compressed into tablets or filled into capsules to form a solid dosage form.

Stability is an important aspect of a pharmaceutical composition. The present invention is based on the discovery that the prior art stability problems associated with amlodipine maleate can be overcome primarily by controlling the pH of the composition to be within the range of about 5.5 to 7.0, preferably of about 6.0-7.0. Within this range the potential degradation reactions are minimized. In particular, the formation of the following degradation product, referred to herein as amlodipine aspartate, is diminished or prevented in this pH range.

Amlodipine Aspartate

5 Amlodipine aspartate is formed by a Michael addition reaction between amlodipine and maleic acid. Because amlodipine and maleic acid are in intimate contact with each other in the amlodipine maleate salt, the chances of the addition reaction occurring increase with time; hence raising a stability issue. By controlling the pH, the addition is significantly slowed or prevented altogether. Thus, it has now
10 been discovered that pH levels above 7.0 tend to encourage the degradation of amlodipine maleate into amlodipine aspartate. Below a pH of about 5.5, other degradation reactions tend to be encouraged, including the pyridine analogue of amlodipine having the following structure:

15 "Amlo-pyridine"

 Preferably the pH of the stabilized composition of our invention is in the range of about 6.0 to 7.0 and more typically from about 6.1 or 6.2 to 6.8. For solid compositions, the pH is determined by forming a slurry of the material with water
20 (demineralized water) and measuring the pH of the slurry, as is understood by workers skilled in the art regarding the pH of a solid composition. The concentration of the composition in the slurry is 20 wt%. The pH is measured by any standard technique.

 The pharmaceutical compositions of the present invention comprise a pharmaceutically effective amount of amlodipine maleate and at least one

pharmaceutically acceptable excipient. Preferably the stability of the composition is such that after three months, more preferably after six months, in an environment controlled room at 40°C/75% RH, it exhibits a loss of amlodipine (or, accordingly, an increase in impurities content) of less than 10 %, preferably less than 5 %, and more preferably less than 1%. Alternatively, the amlodipine maleate pharmaceutical compositions of the present invention preferably exhibit a storage stability equivalent to or superior to amlodipine besylate compositions. For example, the loss of amlodipine during storage to degradation reactions is equivalent to (+/- 10%) or less than the amlodipine loss in amlodipine besylate compositions, especially the commercial product.

The form of the amlodipine maleate is not particularly limited and includes anhydrides, solvates, hydrates and partial hydrates as well as crystalline and amorphous forms. Further, the ratio of amlodipine to maleate can be varied and specifically includes the more common and prior art form of 1:1 as well as a novel 2:1 form described commonly owned co-pending U.S. patent application serial No. 09/809,356, filed on March 16, 2001, and entitled "Amlodipine Hemimaleate," the entire contents of which are incorporated herein by reference.

The amount of amlodipine is not particularly limited and includes any amount that provides a pharmaceutical effect. In particular, amlodipine maleate can be used to treat or prevent hypertension or angina by administering an effective amount to a patient in need thereof. The specific form of angina is not particularly limited and specifically includes chronic stable angina pectoris and vasospastic angina (Prinzmetal's angina). The compound can be administered by any suitable route including orally or parenterally depending on the dosage form. The "patients" intended to be treated include human and non-human animals especially non-human mammals. Generally the amount of amlodipine maleate in a unit dose is from 1 to 100 mg, more typically from 1 to 25 mg, and preferably about 1, 1.25, 2.5, 5 or 10 mg (expressed in terms of the free base).

Amlodipine maleate can be made by any of the known techniques set forth in the prior art, including those described in the above-mentioned patents EP 089 167 and US 4,572,909. It is desirable that the amlodipine maleate active be substantially pure. For example, the content of impurities such as amlodipine aspartate, amlopyridine, etc. that can be produced during the synthesis should be limited, preferably to less than 2 wt %, although such purity is not required for the present invention. A

useful method to produce amlodipine maleate substantially free from amlodipine aspartate is described in commonly owned co-pending U.S. patent application serial No. 09/809,343, filed on March 16, 2001, and entitled "Process for Making Amlodipine Maleate," the entire contents of which are incorporated by reference.

5 Similarly, a useful method for making amlodipine free base is described in commonly owned co-pending U.S. patent application serial No. 09/809,351, filed on March 16, 2001, and entitled "Process For Making Amlodipine, Derivatives Thereof, and Precursors Therefor," the entire contents of which are incorporated herein by reference.

10 The pharmaceutical compositions of the present invention also contain at least one excipient. An "excipient" as used herein means any pharmaceutically acceptable inactive component of the composition. As is well known in the art, excipients include diluents, binders, lubricants, disintegrants, colorants, preservatives, pH-adjusters etc. The excipients are selected based on the desired physical aspects of the
15 final form: e.g., obtaining a tablet with desired hardness and friability, being rapidly dispersible and easily swallowed, etc. The desired release rate of the active substance from the composition after its ingestion also plays a role in the choice of excipients. Preferred release rate is the rate comparable with commercially available amlodipine besylate tablets.

20 Suitable excipients for use in this invention include:

- a diluent such as calcium hydrogen phosphate, lactose, mannitol etc.
- a binder such as microcrystalline cellulose or a modified cellulose, povidone etc.
- a disintegrant such as sodium starch glycollate, crosspovidone
- 25 - a lubricant such as magnesium stearate, sodium stearyl fumarate, talc
- a colorant, taste masking agent etc..

The pH of the composition can be controlled or adjusted by the proper selection of excipients. It should be borne in mind that amlodipine maleate is slightly acidic. For example, amlodipine maleate has a pH of about 4.8 as a saturated aqueous
30 solution. Thus using excipients that are pH inert; i.e., they have little to no effect on pH, generally results in a non-alkaline pharmaceutical composition because the amlodipine maleate essentially acts as its own adjusting agent. An example of a pH-inert excipient is microcrystalline cellulose. A composition comprising amlodipine maleate and microcrystalline cellulose generally exhibits a pH of about 6. For

comparison, the corresponding amlodipine besylate composition generally has a pH of about 7 and the corresponding amlodipine free base composition generally has a pH of about 9. Commercially available tablets comprising amlodipine besylate and sold under brand name Norvasc exhibit a pH typically between 7.05-7.35 (again measured as a 20 wt% slurry).

Excipients having a pH effect can also be used. The pH of these excipients must be taken into account in developing the pharmaceutical composition so that the overall pH of the pharmaceutical composition falls within the range of about 5.5 to 7.0.

For example, the commercially available/pharmaceutically acceptable calcium phosphates are generally alkaline; i.e. pH greater than 7 when measured as described above in a 20% slurry. For instance, DI-TAB, a commercially available dibasic calcium phosphate dihydrate, is reported as having a pH of about 7.4. Nonetheless some forms and grades of calcium phosphate are acidic or neutral pH. This lower pH can be due to the species of calcium phosphate as well as the treatment during processing of the material, such as in removing impurities/washing. For example, dibasic calcium phosphate anhydrate is generally considered to have a pH of about 7.3 whereas A-Tab™ (Rhodia), also a dibasic calcium phosphate anhydrate, has a pH of about 5.0. Further examples of commercially available non-alkaline calcium phosphates include DiCAFOS A (Budenheim) having a pH of about 7 (10 % slurry) and Fujicalin SG (Fuji) having a pH from 6.1-7.2 (5 % slurry). By using a non-alkaline calcium phosphate as an excipient, a pharmaceutical composition meeting the desired pH can be attained. Alternatively, a blend of calcium phosphates, some at pH above 7 and some a pH below 7 can be used to achieve the desired pH of the composition.

Instead of, or in addition to a non-alkaline calcium phosphate, other acidic excipients can be used by themselves or to counter balance an alkaline excipient. An example of such an acidic excipient is the disintegrant Explotab(TM) of Penwest, which is a cross-linked, low substituted sodium starch glycollate. Further, pH adjusting agents can also be used to attained the desired pH. These agents include pharmaceutically acceptable acids such as maleic acid, citric acid or ascorbic acid (the second two have utility also to act as antioxidants) and pharmaceutically acceptable bases such as calcium oxide or magnesium oxide. Salts of weak acids and/or weak

bases are also suitable pH adjustors as they act as buffers imparting pH to lower or higher values according to the chemical nature of their components.

The pharmaceutical compositions of the present invention are not particularly limited in terms of form or route of administration. Oral dosage forms as well as parenteral dosage forms are included. The composition can be in the form of a liquid, solid, or suspension. Preferably, the pharmaceutical composition is a solid dosage form such as a tablet, capsule or sachet intended for oral administration.

Preferred solid dosage forms contain as a major excipient microcrystalline cellulose, a calcium phosphate, especially calcium hydrogenphosphate, or a combination thereof. The sum of the other excipients, if any, is generally less than 25 wt%, more usually less than 10 wt% and in some cases less than 5 wt% of the total pharmaceutical composition. Preferred other excipients are a disintegrant such as sodium starch glycollate and/or a lubricant such as magnesium stearate and/or talc.

For example, a pharmaceutical composition comprising amlodipine maleate and microcrystalline cellulose as the only excipient has been shown to provide good stability against the formation of impurities.

The pharmaceutical compositions of the present invention can be made by techniques generally known in the art. In general, the amlodipine maleate is mixed with one or more excipients to form a blend. The mixing can be carried out wet or dry (i.e. using or not using a solvent or a liquid diluent in the process) and can involve granulating, slugging, or blending of powders. A dry process is however preferred. The blend, after optional further processing, can be compressed into tablets or filled into capsules such as gelatin capsules. Typically the amlodipine maleate to be mixed is in the form of particles. The storage stability of the pharmaceutical composition of the present invention is enhanced, in general, by using larger particle sizes. Preferably the average particle size of the amlodipine maleate is at least 20 microns, more preferably at least 100 microns, and in some embodiments at least 300 microns. If an adjustment of the pH of the composition is needed, it preferably is adjusted before processing into the final form such as a tablet or capsule.

For example, tablets made of the present invention can be prepared, e.g. by a wet granulation of a mixture of amlodipine maleate and a solid carrier/diluent such as calcium phosphate of the proper grade, with the aid of a granulating solvent such as water or ethanol; drying the wet granulate; sieving the granulate; blending with sodium starch glycollate and magnesium stearate and compressing the tablet mixture

For example, tablets made of the present invention can be prepared, e.g. by a wet granulation of a mixture of amlodipine maleate and a solid carrier/diluent such as calcium phosphate of the proper grade, with the aid of a granulating solvent such as water or ethanol; drying the wet granulate; sieving the granulate; blending with sodium starch glycollate and magnesium stearate and compressing the tablet mixture into tablets. The control of pH and/or adjusting the pH value should be advantageously included before blending with magnesium stearate. In this example both the granulating step and the blending step are considered as "mixing" steps since amlodipine maleate and an excipient are mixed.

Yet another suitable process comprises direct compression of the blend of amlodipine maleate and excipient(s). In this process, the ingredients are blended together to form a compressible blend composition that is subsequently compressed into a tablet. A blend that comprises amlodipine maleate, microcrystalline cellulose and/or calcium phosphate, and optionally sodium starch glycollate and/or magnesium stearate may be useful in forming a tablet by direct compression. For example, a blend comprising amlodipine maleate, calcium hydrogen phosphate, microcrystalline cellulose and sodium starch glycollate having a pH of 5.5 to 7.0 can be blended together, re-blended with magnesium stearate and pressurized to form a stable tablet.

The tablets of the present invention comprising amlodipine maleate, microcrystalline cellulose, sodium starch glycollate and magnesium stearate, optionally with addition of calcium hydrogenphosphate, does not suffer from the problem of stickiness to the tablet punch as reported in prior art regarding other amlodipine formulations (see the above cited EP 244 944). Accordingly, the composition of the present invention may be produced in industrial scale without technological problems.

Tablets may be covered with a suitable coating. For example, the coating can be a moisture barrier to help with storage stability or a sustained or delayed release coating composition as are well known in the art.

Alternative dosage forms are capsules, both soft and hard capsules. The stabilized amlodipine maleate composition of the invention as described above is filled into capsules by techniques known in the art, in amounts comprising the desired therapeutical dose of amlodipine.

Suitable package material for packing the pharmaceutical dosage forms are plastic or glass containers and blisters. Particularly blisters made from non-permeable materials (high density polyethylene or aluminium) are advantageous as they may contribute to decreasing the rate of formation of degradation impurities, namely the amlo-pyridine impurity, during storage.

The pharmaceutical compositions of the present invention are used in treating or preventing angina or hypertension, as previously defined, by administering an effective amount of the pharmaceutical composition to a patient in need thereof. Typically the pharmaceutical composition is a unit dose. Individual unit dose compositions generally contain from 1 to 100 mg of amlodipine maleate, more usually from 1 to 25 mg. Preferable are unit doses comprising amlodipine maleate in an equivalent of 1.25, 2.5, 5 or 10 mg of amlodipine, such as tablets or capsules for oral administration. The pharmaceutical composition is administered from 1 to 3 times daily, preferably once a day. The above compositions are also useful in reducing heart failure symptoms, improving systolic left ventricular function and increasing exercise capacity in patients with ischaemic LVD and heart failure without current angina.

Amlodipine maleate compositions of our invention may be also used in medical applications in combination with other antihypertensive and/or antianginal agents, for instance with ACE- inhibitors such as benazepril. The combination may be realized in a form of single combination preparation, e.g. a capsule containing amlodipine maleate and benazepril hydrochloride, or by separate administration of drugs containing the above agents. Similarly, amlodipine maleate may also be combined with HMG-CoA reductase inhibitors, particularly statins such as lovastatin, simvastatin, atorvastatin, etc.

Accordingly, the present invention further provides a method for treating and/or preventing any one or more of angina, hypertension and heart failure (the Disorders) by administering a pharmaceutical composition of our invention comprising an effective and/or prophylactic amount of amlodipine maleate to a sufferer in need thereof.

The present invention also provides the use of the composition of the invention in the manufacture of a medicament for treating and/or preventing any one or more of the Disorders.

Examples

EXAMPLE 1 Amlodipine maleate tablets based on calcium phosphate excipient

5

a) Tablet compositions comprising calcium phosphate of different pH

Batch number	(A)	(B)	(C)	(D)	(E)	(F)
Equivalent of amlodipine	2.5 mg	10 mg	2.5 mg	10 mg	2.5 mg	10 mg
Amlodipine maleate	3.21 mg	12.8 mg	3.21 mg	12.8 mg	3.21 mg	12.8 mg
Calcium hydrogen phosphate anhydrous: - Di CAFOS A - A-TAB - Fujicalin	31.5 mg	126.0 mg	31.5 mg	126.0 mg	31.5 mg	126.0 mg
Microcrystalline cellulose	62.05 mg	248.1 mg	62.05 mg	248.1 mg	62.05 mg	248.1 mg
Sodium starch Glycollate	2.0 mg	8.0 mg	2.0 mg	8.0 mg	2.0 mg	8.0 mg
Magnesium Stearate	1.0 mg	4.0 mg	1.0 mg	4.0 mg	1.0 mg	4.0 mg
Total	99.76 mg	398.9 mg	99.76 mg	398.9 mg	99.76 mg	398.9 mg

Types of anhydrous calcium hydrogenphosphate used

10

Batch no.	Final pH of 20% (m/V) slurry of tabs	Type of CaHPO ₄ .	Supplier of CaHPO ₄ .	pH of 5% (m/V) slurry of CaHPO ₄	pH of 20% (m/V) slurry of CaHPO ₄
(A), (B)	6.13, 6.19	Di CAFOS A	Budenheim	7.29	6.69
(E), (F)	5.74, 5.74	Fujicalin	Fuji	6.12	5.62
(C), (D)	5.53, 5.54	A-TAB	Rhone-Poulenc	6.03	5.25

b) Tablet compositions comprising amlodipine maleate of different particle sizes

Batch number	(G)	(H)	(I)
Equivalent of amlodipine base	2.5 mg	10 mg	2.5 mg
Amlodipine maleate, milled	3.21 mg	12.8 mg	-
Amlodipine maleate	-	-	3.21 mg
Calciumhydrogenphosphate anhydrous (pH 6.7)	31.5 mg	126.0 mg	31.5 mg
Microcrystalline cellulose	62.05 mg	248.1 mg	62.05 mg
Sodium starch glycollate	2.0 mg	8.0 mg	2.0 mg
Magnesium Stearate	1.0 mg	4.0 mg	1.0 mg
Total	99.76 mg	398.9 mg	99.76 mg

- 5 Particle size of the amlodipine maleate substance used for production of batches A – F was measured by laser diffraction and it was proven that less than 90% of particles is smaller than 204 microns and 50% of particles is smaller than 80 microns.

- 10 This amlodipine maleate was milled to a particle size of 10-20 microns and used for producing batches (G) and (H). Alternately, another batch of amlodipine maleate with particle sizes 90% less than 11 microns and 50% less than 6 microns was used for producing batch (I).

c) Manufacturing procedures

- 15 Batches (A) – (F) and (I) have been manufactured as follows:

- The amlodipine maleate was sieved through a 500 µm screen.
- The other excipients have been sieved through a 850 µm screen.
- All excipients except magnesium stearate have been mixed in a free fall mixer for 15 minutes at about 25 rpm. Value of pH was checked at 20% aqueous slurry.
- 20 - Magnesium stearate was added and the powder blend was mixed for another 5 minutes at about 25 rpm.
- 2.5 mg and / or 10 mg tablets have been compressed using a Korsch EK0 excenter press.

Batches (G) and (H) have been manufactured as follows:

- Amlodipine maleate was milled
- The other excipients have been sieved through a 850 µm screen.
- 5 - All excipients except magnesium stearate have been mixed in a free fall mixer for 15 minutes at about 25 rpm. Value of pH was checked at 20% aqueous slurry.
- Magnesium stearate was added and the powder blend was mixed for another 5 minutes at about 25 rpm.
- 2.5 mg / 10 mg tablets have been compressed on Korsch EK0 excenter press.

10

Example 2 Tablets comprising microcrystalline cellulose

a) Composition

Batch number	(J)	(K)
Equivalent of amlodipine base	2.5 mg	10 mg
Amlodipine maleate	3.21 mg	12.8 mg
Microcrystalline cellulose	75.55 mg	302.1 mg
Predried potato starch	20.0 mg	80.0 mg
Magnesium Stearate	0.5 mg	2.0 mg
Talc	0.5 mg	2.0 mg
Total	99.76 mg	398.9 mg

15

Manufacturing process

- Amlodipine maleate was sieved through a 500 µm screen.
- The other excipients have been sieved through a 850 µm screen.
- All excipients except magnesium stearate and talc have been mixed in
- 20 a free fall mixer for 15 minutes at about 25 rpm. Value of pH was checked at 20% aqueous slurry.
- Magnesium stearate and talc were added and the powder blend was mixed for another 5 minutes at about 25 rpm.
- 2.5 mg and 10 mg tablets have been compressed using a Korsch EK0
- 25 excenter press.

Properties of tablet composition :

pH of 20% (w/V) slurry : - Batch (J) = 5.92

- Batch (K) = 5.96

5

EXAMPLE 3 Amlodipine maleate tablets comprising mannitol

Composition

Batch number	(L)
Equivalent of amlodipine base	10 mg
Amlodipine maleate	12.8 mg
Mannitol	370.1 mg
Sodium starch glycollate	8.0 mg
Magnesium Stearate	6.0 mg
Talc	2.0 mg
Total	398.9 mg

10

Manufacturing procedure

- Amlodipine maleate was sieved through a 500 µm screen.
 - The other excipients have been sieved through a 850 µm screen.
 - All excipients except magnesium stearate and talc have been mixed in a free fall mixer for 15 minutes at about 25 rpm. Value of pH was checked at 20% aqueous slurry.
- 15
- Magnesium stearate and talc were added and the powder blend was mixed for another 5 minutes at about 25 rpm.
 - 10 mg tablets have been compressed using a Korsch EK0 excenter press.

Example 4 Amlodipine maleate tablets having pH higher than 7
(comparative example)

Composition (pH of the 20% w/v slurry : 8.68)

5

Batch number	(X)
Equivalent of amlodipine base	2.5 mg
Amlodipine maleate	3.21 mg
Calcium hydrogenphosphate anhydrous (pH 6.69)	31.5 mg
Magnesium oxide ponderosum	0.5 mg
Microcrystalline cellulose	62.05 mg
Sodium starch glycollate	2.0 mg
Magnesium Stearate	1.0 mg
Total	100.26 mg

Manufacturing process

- The amlodipine maleate was sieved through a 500 µm screen.
- The other excipients have been sieved through a 850 µm screen.
- 10 - Amlodipine maleate, magnesium oxide and about 30 % of the amount of microcrystalline cellulose (MCC) were mixed in a free fall mixer for 10 minutes at about 25 rpm.
- The remaining amount of MCC, calcium hydrogenphosphate anhydrous and sodium starch glycollate were added and the blend was mixed in a free
15 fall mixer for 15 minutes at about 25 rpm. Value of pH was checked at 20% aqueous slurry.
- Magnesium stearate was added and the powder blend was mixed for another 5 minutes at about 25 rpm.
- 2.5 mg tablets and proportionately larger 10 mg tablets have been
20 compressed using a Korsch EK0 excenter press.

Example 5 Stability studies on amlodipine maleate tablets

Stability studies on batches produced in Examples 1-4 were performed in a thermostated chamber adjusted to 40 ± 2 °C and 75 ± 5 % of relative humidity in various package materials (HDPE bottles, PVC/PVDC/PE blisters) or on an open
5 dish. Assay of the active substance and of the content of impurities was performed by HPLC method, using reference materials of amlodipine maleate and major degradation impurities :

amlodipine aspartate (Z#204)

amlo-pyridine (Z# 202)

10 Apart, two minor impurities Z#203 and Z#205 were detected and identified.

The content of other detected impurities/degradation products was calculated by internal normalization.

In the following tables, the assay of the active substance is expressed in miligrams, the content of impurities is expressed in per cent.

Example 6 Amlodipine maleate capsules

Compositions

10

Batch number	(CA), (CB)
Equivalent to amlodipine	5.0 mg
Amlodipine maleate	6.42 mg
Microcrystalline cellulose	72.6 mg
Predried potato starch	20.0 mg
Magnesium stearate	0.5 mg
Total	99.52 mg

Batch number	(CC)	(CX)
Equivalent to amlodipine	5.0 mg	5.0 mg
Amlodipine maleate	6.42 mg	6.42 mg
Calcium hydrogenphosphate anhydrous	31.5 mg	31.5 mg
Magnesium oxide	-	1.5 mg
Microcrystalline cellulose	62.0 mg	62.0 mg
Sodium starch glycollate	2.0 mg	2.0 mg
Magnesium stearate	1.0 mg	1.0 mg
Total	102.92 mg	104.43 mg

pH of capsules at t=0

Batch no.	Strength	Type of Calcium hydrogenphosphate anhydrous	pH of 20% (m/V) slurry of capsule content
(CC)	5.0 mg	Di CAFOS A	6.10
(CX)	5.0 mg	Di CAFOS A	9.59

5

Batch (CA) has been manufactured as follows:

- The amlodipine maleate was sieved through a 500 µm screen.
- The other excipients have been sieved through a 850 µm screen.
- All excipients except magnesium stearate have been mixed in a free fall mixer for 15 minutes at about 25 rpm. pH value was checked in 20% aqueous slurry.
- Magnesium stearate was added and the powder blend was mixed for another 5 minutes at about 25 rpm.
- *gelatine* capsules have been filled with this powder blend

15

Batch (CB) has been manufactured as follows:

- The amlodipine maleate was sieved through a 500 µm screen.
- The other excipients have been sieved through a 850 µm screen.
- All excipients except magnesium stearate have been mixed in a free fall mixer for 15 minutes at about 25 rpm. pH value was checked in 20% aqueous slurry.
- Magnesium stearate was added and the powder blend was mixed for another 5 minutes at about 25 rpm.
- *HPMC* capsules have been filled with this powder blend

25

Batch (CC) has been manufactured as follows:

- The amlodipine maleate was sieved through a 500 µm screen.
- The other excipients have been sieved through a 850 µm screen.
- All excipients except magnesium stearate have been mixed in a free
5 fall mixer for 15 minutes at about 25 rpm. pH value was checked in 20% aqueous
slurry.
- Magnesium stearate was added and the powder blend was mixed for
another 5 minutes at about 25 rpm.
- *gelatine* capsules have been filled with this powder blend

10

Batch (CX) has been manufactured as follows:

- The amlodipine maleate was sieved through a 500 µm screen.
- The other excipients have been sieved through a 850 µm screen.
- Amlodipine maleate, magnesium oxide and about 30 % of the amount
15 of microcrystalline cellulose (MCC) were mixed in a free fall mixer for 10 minutes at
about 25 rpm.
- The remaining amount of MCC, calcium hydrogenphosphate
anhydrous and sodium starch glycollate were added and the blend was mixed in a free
fall mixer for 15 minutes at about 25 rpm. pH value was checked in 20% aqueous
20 slurry.
- Magnesium stearate was added and the powderblend was mixed for
another 5 minutes at about 25 rpm.
- *gelatine* capsules have been filled with this powderblend, using an
automatic capsule filling machine.

The invention having been described, it will be readily apparent to those skilled in the art that further changes and modifications in actual implementation of the concepts and embodiments described herein can easily be made or may be learned
5 by practice of the invention, without departing from the spirit and scope of the invention as defined by the following claims

CLAIMS

- 5 1. A pharmaceutical composition comprising an effective amount of
amlodipine maleate and at least one pharmaceutically acceptable excipient wherein
said composition has a pH within the range of 5.5- 7.0.
2. The composition according to claim 1, wherein said composition has a
10 pH of about 6.0 - 7.0.
3. The composition according to claims 1 or 2, wherein said composition
is in solid form.
- 15 4. The composition according to any of the preceding claims, wherein
said excipient is calcium phosphate or microcrystalline cellulose.
5. The composition according to claim 4, wherein said composition
comprises calcium phosphate and microcrystalline cellulose.
- 20 6. The composition according to claim 4, wherein said excipient is
calcium hydrogen phosphate.
7. The composition according to claim 4, wherein said excipient is
25 microcrystalline cellulose.
8. The composition according to any of the preceding claims, further
comprising an acidic pH adjusting agent.
- 30 9. The composition according to any of the preceding claims, wherein
said composition is in the form of a tablet.

10. The composition according to claim 9, which further comprises an outer moisture and/or light barrier layer surrounding said tablet.

11. The composition according to any of the preceding claims 1-8, wherein
5 said composition is in the form of a capsule.

12. The composition according to any of the preceding claims, wherein said amount of amlodipine maleate corresponds to 1.0 to 25 mg of amlodipine free base.

10

13. The composition according to claim 12, wherein said amount of amlodipine maleate corresponds to 1.25, 2.5, 5 or 10 mg of amlodipine free base.

14. A method for treating or preventing angina or hypertension or heart
15 failure, which comprises administering to a patient in need thereof an effective amount of the composition according to any of the claims 1-13.

15. A process for making the composition according to any of the claims 1, 3-13 or 2-13, which comprises mixing amlodipine maleate and at least one
20 pharmaceutically acceptable excipient to form a mixture having a pH within the range of 5.5 to 7, or 6.0 – 7.0 respectively.

16. A process, which comprises:
mixing amlodipine maleate and at least one pharmaceutically acceptable excipient to
25 form a mixture having a pH of 5.5-7.0.

17. The process according to claim 16, which further comprises compressing said mixture into a tablet.

18. The process according to claim 16, which further comprises filling
30 capsules with said mixture to form a pharmaceutical dosage form.

19. The process according to claim 16, wherein said mixing is carried out by wet granulation.

20. The process according to claim 16, wherein said mixing is carried out by a dry method.

5 21. The process according to claim 20, wherein said amlodipine maleate is mixed as solid particles having an average particle size of at least 100 microns with said excipient.

22. A tablet made according to the process of any of the claims 16, 17, 19,
10 20, 21.

23. A process, which comprises:
mixing solid particles of amlodipine maleate, having an average particle size of at least 20 microns, with a pharmaceutically acceptable excipient to form a mixture.

15

24. The process according to claim 23, which further comprises filling capsules with said mixture to form a pharmaceutical dosage form.

25. The process according to claim 23, which further comprises
20 compressing said mixture to form a tablet.

26. The process according to claim 23, wherein said average particle size is at least 100 microns.

25 27. The process according to claim 23, wherein said mixture is blended with one or more appropriate excipients so as to have a pH within the range of 5.5 to 7.

28. The use of a composition according to any of the claims 1-13 for the
30 manufacture of a medicament for the treatment of angina, hypertension or heart failure.

X	WO 95 34299 A (TELOR OPHTHALMIC PHARMACEUTICALS) 21 December 1995 (1995-12-21) claims 11,14,15 page 7, line 27 -page 8, line 3 ---	1,2,4, 13,15,16
A	WO 95 05822 A (PFIZER) 2 March 1995 (1995-03-02) the whole document ---	1-28
E	WO 01 74390 A (PFIZER) 11 October 2001 (2001-10-11) claims 1,3,9 page 4, line 1 - line 7 page 6, line 1 - line 16 page 7, line 4 - line 15 example 1 ---	1-7,9, 11-20,28
	-/--	

☒ Further documents are listed in the continuation of box C.

☒ Patent family members are listed in annex.

* Special categories of cited documents:

- *A* document defining the general state of the art which is not considered to be of particular relevance
- *E* earlier document but published on or after the international filing date
- *L* document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)
- *O* document referring to an oral disclosure, use, exhibition or other means
- *P* document published prior to the international filing date but later than the priority date claimed

- *T* later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention
- *X* document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone
- *Y* document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art.
- *&* document member of the same patent family

Date of the actual completion of the international search

21 May 2002

Date of mailing of the international search report

29/05/2002

Name and mailing address of the ISA

European Patent Office, P.B. 5818 Patentlaan 2
NL - 2280 HV Rijswijk
Tel. (+31-70) 340-2040, Tx. 31 651 epo nl,
